Leena M

Texas, US | +1 (972) 776-4448 | leenakrishna94@gmail.com

Professional Summary

Senior Consultant with 8+ years of experience translating complex business workflows into technical specifications, incremental delivery plans, and stakeholder-ready solutions. Brings a delivery-focused approach to **agentic AI and LLM application engineering**, including retrieval, structured outputs, tool calling, validation, testing, and human review paths. Experienced in connecting requirements, data processing, APIs, workflow integrations, security controls, and operational readiness so working vertical slices can move toward production with traceable decisions and verification evidence. Comfortable communicating trade-offs, risks, dependencies, and implementation status to technical and nontechnical stakeholders.

Technical Skills

Agentic AI Engineering: LLM applications, retrieval, structured outputs, prompt versioning, tool/function calling, output validation

Application and Data Engineering: Backend services, APIs, workflow integrations, Databricks notebooks/jobs, SQL transformations, data processing

Data Quality and Reproducibility: Schema validation, deduplication, reconciliation, normalization, matching, comparison, versioned processing rules

Evaluation and Testing: Unit, integration, end-to-end, regression, negative testing, evaluation datasets, grounding and abstention assessment

Security and Governance: Least privilege, authorization boundaries, secure authentication, secrets management, data-access restrictions, AI-DLC controls

Operational Readiness: Telemetry, prompt/model traceability, usage and cost attribution, monitoring, rollback procedures, runbooks, support handoff

Delivery Collaboration: Requirements discovery, user stories, acceptance criteria, architecture decisions, risk communication, reviewer-facing workflows

Professional Experience

Senior Consultant | Elevance Health

February 2026 - Present

- Partner with business users and subject-matter experts to map workflows, pain points, exceptions, and desired outcomes into actionable delivery requirements.
- Translate discovery findings into technical specifications, user stories, testable acceptance criteria, and incremental plans for working vertical slices.
- Evaluate whether a workflow is best served by deterministic logic, conventional automation, retrieval, or an AI agent based on risk, repeatability, and business value.
- Develop bounded LLM capabilities for research, explanation, recommendation, and workflow assistance with explicit scope and human decision authority.
- Implement structured outputs, context retrieval, prompt versioning, tool/function calling, and output validation to make model behavior more predictable and reviewable.
- Design tool contracts with explicit permissions, schemas, failure behavior, and audit requirements, enforcing authorization in application code and tool permissions.
- Ground responses in approved and versioned sources while preserving supporting evidence links for reviewer verification and downstream decisions.
- Build backend services, APIs, data-processing components, and workflow integrations with retry, idempotency, timeout, and recovery patterns.
- Instrument application behavior, retrieval, tool calls, model usage, failures, and dependencies while protecting sensitive telemetry and enabling remediation.

Senior Consultant | Optum

October 2024 - February 2026

- Conducted embedded discovery with business stakeholders to clarify operating context, exception paths, user needs, and measurable acceptance conditions.
- Converted business requirements into traceable technical work items and delivery slices that connected user value to implementation and verification evidence.
- Developed Databricks notebooks and jobs with SQL transformations for ingestion, normalization, matching, comparison, and validation workflows.
- Implemented data-quality checks, schema validation, deduplication, reconciliation, and versioned processing rules to support reliable downstream use.
- Built retrieval and workflow assistance patterns that constrained context to approved sources and surfaced links to evidence supporting an answer.
- Added human review, escalation, abstention, and fallback behavior for cases where model confidence, evidence, authorization, or data quality was insufficient.
- Created unit, integration, end-to-end, regression, and negative tests covering model outputs, unauthorized tool use, prompt injection, sensitive-data exposure, and failure scenarios.
- Maintained architecture decisions, prompt and tool documentation, approval evidence, and delivery records for technical and nontechnical reviewers.

Consultant | LatentView

June 2022 - August 2024

- Analyzed business processes and data flows to identify automation opportunities, unresolved dependencies, and the smallest useful vertical slice for delivery.
- Prepared user stories, acceptance criteria, technical notes, and decision records that aligned solution behavior with stakeholder expectations.
- Developed SQL-based transformations and validation logic for ingestion, normalization, matching, comparison, reconciliation, and repeatable processing.
- Supported backend services and API integrations with explicit input and output contracts, error handling, retry behavior, and traceable execution records.
- Evaluated AI outputs for grounding, correctness, usefulness, safety, and appropriate abstention using representative datasets and domain feedback.
- Collaborated on reviewer-facing interfaces and end-to-end application behavior, preserving human authority over final business decisions.
- Produced deployment guidance, troubleshooting notes, rollback considerations, and support handoff materials for operational teams.

Consultant | Reylon Softech

June 2018 - June 2022

- Gathered requirements from business users and translated process needs into implementation tasks, validation rules, and reviewable delivery outcomes.
- Built and maintained application integrations, APIs, and data-processing components with attention to input contracts, error handling, and recovery paths.
- Developed SQL transformations and data-quality checks for normalization, validation, deduplication, comparison, and reconciliation workflows.
- Created test cases and regression checks that traced delivered behavior to requirements, acceptance criteria, and known failure scenarios.
- Documented technical decisions, operating procedures, dependency assumptions, and support guidance for stakeholder and delivery-team use.
- Communicated technical trade-offs, implementation risks, and unresolved issues clearly while escalating decisions requiring accountable business or security owners.

Education

Master's in Cybersecurity | Saint Louis University

May 2026
